

Section 1: Purpose-led Governance and Board Leadership

Primary Purpose of Board

CEOs most frequently identify their board's primary purpose as overseeing financial strategy and resource allocation (44%), followed by a strategic partner to management (34%). CEOs could select up to two roles, as boards may have more than one primary purpose (total selections >100%). Agriculture companies were 22 percentage points more likely than total for-profits to report overseeing financial strategy and resource allocation as their board's primary purpose.

Board and management alignment

Alignment between board and management roles is important for governance because it underpins clear decision rights, accountability, and effective oversight. Alignment is generally strong, with 25% of CEOs stating that the roles are completely aligned. However, some organisations may still face risks associated with role ambiguity or boundary overlap. It highlights an opportunity to enhance role clarity and optimise governance effectiveness.

Board structure and composition for effective governance

Boards most commonly report that their structure ensures integrated financial and non-financial reporting (50%) and aligns composition to reflect stakeholder experience and perspectives (50%). In contrast, fewer report that their board structure oversees performance metrics on culture (25%) and aligns composition to reflect the gender and ethnic diversity of stakeholders (17%), highlighting an opportunity to strengthen how board structures support broader organisational priorities. Agriculture companies are 17 percentage points more likely to report that their board fully 'aligns composition to reflect stakeholder experience and perspectives'.

Agriculture: 30 CEOs

Extent of formal board oversight across key areas

Many boards embed oversight of long-term strategy (63%), core organisational purpose (58%), and financial sustainability and value creation (38%) within strategic oversight. However, fewer boards embed environmental and social externalities (25%), stakeholder governance (13%), and organisational culture (8%), highlighting an opportunity for organisations to more consistently integrate factors that influence strategy, risk, and long-term value. Agriculture companies are less likely to report that their board embeds organisational culture into strategic oversight.

Board methods of evaluating own governance and oversight effectiveness

While organisations routinely evaluate management and organisational performance, board governance itself is often assessed more informally. With 49% relying on assessments of board composition and skills alignment with strategy and 46% using informal or ad hoc discussions, many boards have an opportunity to strengthen oversight and better enable organisational performance by adopting more formal, objective evaluation methods. Agriculture companies are more likely to rely on assessments of board composition and skills alignment with strategy.

Effectiveness of CEO–chair relationship

The CEO–Chair relationship is central to governance, sitting at the interface between board and management and shaping oversight, communication, and strategic alignment. CEO–Chair relationships are generally strong: 70% of CEOs rated the chair "highly effectively" 'supports mutual support and trust', followed by 'supports effective communication and collaboration' (65%), and 'contributes to strategic priorities' (55%). The lower ratings for 'enables leadership effectiveness' and 'provides clear expectations and feedback' indicate opportunities to strengthen these relationships to enhance the CEO's ability to lead optimally.

Agriculture: 30 CEOs

Board effectiveness in enabling organisational purpose

Even some of the strongest boards have room for improvement: 38% of CEOs rate their board as 'highly effective' in supporting the right level of strategic risk taking, followed by 38% in supporting oversight of compliance and organisational risks, and 38% in providing strategic guidance and decision-making. More than 63% of boards are not highly effective in enabling organisational purpose in these factors; if these are not addressed, they risk leaving value on the table. Agriculture companies are less likely than total for-profits to rate highly on 'supporting constructive board culture and dynamics' in enabling organisational purpose.

Areas the board could more effectively support and enable leadership

CEOs view board effectiveness as an important contributor to organisational performance. CEOs identify that boards could more effectively support and enable leadership, with 60% highlighting enhanced alignment between board members on organisational priorities, 48% more diverse skills and expertise on the board, and 40% provide stronger support for the long-term strategic plan. Agriculture companies are 31 percentage points more likely than total for-profits to identify 'enhanced alignment between board members on organisational priorities to enable organisational purpose' as a way to enhance organisational performance.

Agriculture: 30 CEOs

Section 2: CEO Personal Motivation, Values, and Alignment

Personal CEO motivations

CEO motivation is an important issue that has not been studied directly by asking CEOs. Attracting and retaining the right CEO is an important governance issue. The existing literature does not directly measure CEO motivation, instead inferring it from incentive structures (such as compensation design), observed CEO behaviour (e.g. risk-taking or earnings management), and governance outcomes (e.g., pay-performance sensitivity or compensation levels). CEO responses suggest that intrinsic and purpose-driven motivations rank highest, followed by reputation-related motivations, while financial or visibility-related factors are least prominent. Specifically, 83% of CEOs rated core organisational purpose as very important, followed by strategic challenge (73%) and intellectual stimulation (73%), whereas only 0% rated high-stakes visibility and 0% rated variable or long-term incentives as very important motivators.

Key factors CEOs view as determinants of their pay

While the literature emphasises market benchmarks, managerial bargaining power, and incentive alignment, CEOs instead view pay as primarily driven by perceived individual ability and board judgment, with relatively little importance placed on negotiation or financial motivation. Specifically, 70% rating ability (skills and potential to deliver), 47% experience (past roles, achievements) and 40% board's assessment of performance as very important determinants of pay, compared with 17% for stakeholder or political influence, 7% for financial motivation and 3% for negotiation at the time of appointment. CEOs view remuneration as recognition of the strategic value they are expected to create and the risks they assume in delivering organisational outcomes. Agriculture companies are 11 percentage points more likely than total for-profits to consider the market rates and peer remuneration levels as a key determinant.

Agriculture: 30 CEOs

CEO's views on fixed and variable pay

Most CEOs agree that 'rewards should reflect sustained, not just annual performance' (83%), that 'pay should be linked to performance' (67%), and that 'the pay mix should reflect organisational context' (67%). In comparison, CEOs are most neutral on 'the pay structure matters less if long-term incentives are honoured' (67%) and on whether 'the pay mix signals short- vs long-term priorities' (66%), indicating comfort with variable-based pay structures. CEO responses show limited evidence of self-interested, short-term or rent-extractive behaviour as assumed in the academic literature.

CEO perspective on the impact of current incentives being made longer-term

Most CEOs agree that longer-term incentives tend to 'signal that long-term value creation is a priority' (87%) and 'provide stronger alignment with long-term mission' (73%). Despite academic research suggesting executives prefer more immediate pay, CEOs are most neutral that they 'make incentives less motivating' and 'make pay less fair'. Most said it is unlikely or somewhat unlikely that it would 'increase the likelihood of leaving the role'.

CEO's views on the credibility of pay-linked KPIs for their own performance

CEOs believe that pay-linked KPIs are most credible for 'financial performance' (77%) and 'service delivery, quality and outcomes' (73%), moderately credible for 'employee engagement and wellbeing' (57%) and 'organisational culture and values' (40%), and least credible for 'stakeholder satisfaction' (30%) and 'environmental or social impact' (17%). Many see these measures as somewhat credible, with very few rating any measure as not credible. Agriculture companies are 8 percentage points less likely than total for-profits to agree that organisational culture and values are a credible and fair way to assess CEO performance.

Agriculture: 30 CEOs

CEOs offered below-expected remuneration during their time in leadership

- Not offered below-expected pay
- Offered below-expected pay

A key governance signal is potential misalignment between CEO remuneration and candidate expectations, creating attraction, retention, and leadership continuity risk. During their time in leadership, 40% of CEOs reported experiencing total pay offers below what they felt was appropriate, often leading to career-management responses, whereas 60% did not. CEOs in agriculture companies were 4 percentage points less likely than total for-profits to have been offered below-expected pay.

Leader consequences of lower-than-expected pay offers

Boards risk weaker leadership quality, poorer strategic continuity, and reduced ability to attract and retain capable CEOs when pay is set below appropriate market levels. The most common responses for CEOs who received lower than expected pay offers included that they felt undervalued (43%) and accepted and renegotiated later (34%), highlighting that executives often respond to perceived underpayment by managing their career trajectory around it, with potential implications for longer-term commitment and board-CEO alignment. CEOs in agriculture companies were 27 percentage points less likely than total for-profits to have accepted the role as a stepping stone.

Agriculture: 30 CEOs

Section 3: Executive and Senior Leaders Signals, Pay and Incentives

Signals of strategy, culture, and sustainability for executive & senior leaders

Leadership incentives, KPIs and succession decisions aligned with sustainability, culture and strategy are social and governance mechanisms as they determine how effectively leadership behaviour is shaped, monitored and held accountable for delivering organisational purpose and sustained value creation. 50%–69% of CEOs integrate core strategic performance into executive hiring, promotion, succession and KPIs, compared with 31%–38% for culture and 31% for sustainability. Reward systems have a stronger focus on strategic goals rather than their execution (culture) or being a responsible citizen (sustainability).

Senior leader behavioural alignment with organisational purpose and values

Alignment between leadership behaviour, decision-making and representation influences organisational trust, inclusivity and long-term effectiveness. Between 53% and 83% of CEOs report that senior leaders strongly support organisational purpose through communication, modelling, decision-making and behavioural reinforcement. In comparison, only 27% believe leadership ensures diverse decision-making, and 10% say leadership diversity reflects the community and stakeholders, highlighting an opportunity to align behaviour and structural inclusivity.

Executive remuneration framework effectiveness

Effective remuneration systems are important because they support fair, performance-linked pay, strengthen accountability, and help align leadership behaviour with organisational objectives while maintaining trust in social and governance processes. 80% of respondents agree or somewhat agree that current frameworks support fair and effective pay decisions, and 72% agree or somewhat agree that expectations can be aligned with performance pay. In contrast, 29% perceive pay-setting to be constrained by reputational or external risk.

Agriculture: 30 CEOs

Factors influencing executive or senior leader pay decisions

Executive and senior leader pay decisions are driven primarily by governance factors, including financial performance, benchmarking, stakeholder expectations and formal pay policies, which reflect how boards exercise oversight, manage accountability and align remuneration with organisational objectives. Social factors are also evident, with employee retention, motivation and internal equity concerns reflecting workforce and cultural implications of executive pay decisions, including fairness, trust and cohesion. Comparatively, external pressures such as advisory firms, media or political risk have limited influence. CEOs in agriculture companies were 9 percentage points more likely than total for-profits to cite market benchmarking and competitive pay levels.

Percentage of staff motivated by sustainability goals

The majority of CEOs believe that staff are highly aligned with the organisation's purpose, including social, environmental, and broader stakeholder objectives, with the average CEO estimating alignment at around 78% of all staff. This percentage is meaningful because it indicates the extent to which that purpose is embedded in employee behaviour, shaping execution capability, cultural coherence, and the credibility of the organisation's ESG commitments.

Willingness to support culture shift for sustainability goals

- Not at all open to change
- Minimally open to change within current norms
- Moderately open to change with structured plans
- Fully open to transformational change

An organisation's willingness to pursue cultural change for sustainability is important because it signals whether environmental and social commitments can be embedded in organisational behaviour and governance, rather than remaining at the level of policy or reporting. 81% of organisations are willing to pursue cultural change to support sustainability goals, with 52% favouring structured change and 30% open to transformational change. Because willingness is high, organisations may benefit from targeted support such as practical tools for embedding sustainability, leadership guidance, and staff or board training to enable deeper, systemic change. CEOs in agriculture companies were 4 percentage points more likely than total for-profits to be moderately open to change with structured plans.

Agriculture: 30 CEOs

Section 4: Sustainability Strategy and Investment Priorities

Impact of **environmental** and **social** investments on organisational value

■ Do not add value

■ Add value

The majority of CEOs (87%) believe investing in environmental and social practices enhances their organisation's value, while 13% say it does not. This highlights that most CEOs view environmental and social practices as value-enhancing, reinforcing their role as a core driver of long-term strategic decision-making rather than a peripheral concern. CEOs in agriculture companies were 6 percentage points more likely than total for-profits to believe these practices add value.

Reasons sustainability adds value

87% of CEOs say sustainable practices enhance their organisation's value, primarily due to ethical responsibility (81%) and integration into strategy (69%). CEOs in agriculture companies were 27 percentage points more likely than total for-profits to believe these practices aid in regulatory preparedness.

Sustainability does not add value due to:

13% of CEOs do not believe that sustainable practices enhance organisational value, primarily due to regulation and policy uncertainty (50%) or low priority despite stakeholder preference (50%). CEOs in agriculture companies were less likely to have doubts that investments deliver value.

Agreement with statements on sustainable business practices

The majority of CEOs agree that sustainable practices helps identify environmental, social, legal, and stakeholder risks (87%), demonstrate a long-term commitment to ethical operations (83%) and support organisational credibility and trust among stakeholders (73%). Sustainable business practices are viewed as an integrated driver of competitiveness, stakeholder trust, and risk management, rather than a peripheral activity.

Agriculture: 30 CEOs

Material **environmental** factors driving strategic priorities and long-term value

Environmental sustainability factors

Agriculture companies are more likely to consider energy and fuel efficiency (73%) and climate adaptation and resilience (60%) as the primary drivers of long-term environmental value.

Product and supply chain sustainability factors

CEOs view product quality and safety (70%) and supply chain resilience (57%) as the primary drivers of long-term product and supply chain value. Agriculture companies are more likely to view sustainable material sourcing as material.

Material **social** factors influencing strategic priorities and long-term value

Workforce sustainability factors

CEOs view employee well-being (97%) and employee health and safety (97%) as the primary workforce sustainability value drivers. Agriculture companies are less likely to consider workforce sustainability skills as material.

Stakeholder sustainability factors

CEOs view community relations (63%) and data security and privacy (60%) as the primary social stakeholder drivers of long-term value. Agriculture companies are less likely to view customer sustainability satisfaction as material.

Material **governance** factors

Governance sustainability factors

CEOs view 'leadership and board policies' (80%) and 'data governance' (70%) as the primary governance drivers of long-term value. Agriculture companies are more likely to consider 'data governance' as material.

Approach to sustainability strategy

The most common approach to sustainability is full integration: sustainability is woven into the fabric of the organisation, embedded in strategy, culture, operations, and innovation (30%).

Agriculture: 30 CEOs

Key barriers to integrating sustainability into strategy and operations

Organisations see measurement and reporting costs (53%) as the most common barrier to integrating sustainability into strategy and operations, followed by high initiative costs (50%) and weak links to operational outcomes (40%). CEOs in agriculture companies were 11 percentage points more likely than total for-profits to see measurement and reporting costs as a barrier.

Government or industry body actions that most support sustainability goals

Based on selection frequency, CEOs identify financial incentives to accelerate investments (60%) and clear, consistent reporting standards (47%) as the most important actions government or industry bodies can take to support sustainability goals, followed by standardised metrics and assurance frameworks (43%). CEOs in agriculture companies were 18 percentage points more likely than total for-profits to see an investment in sector-wide skills and capability as important.

Willingness to pay for greener outcome Tolerance for sustainable project delays

Greener versus conventional options (% of CEOs across premium levels)

46% of CEOs would pay a moderate premium (5%–10%) for greener technology: 39% would pay a premium of over 20%, while 14% would not pay more. CEOs in agriculture companies were 12 percentage points more likely than total for-profits to say they would pay up to a 20% premium.

Time delay for environmental or social gains (% of CEOs by delay length)

Most CEOs tolerate short delays for higher environmental or social gains: 34% up to 1 year, 3% up to 3–5 years, and 45% would not delay. CEOs in agriculture companies were 6 percentage points more likely than total for-profits to say they delay up to 1 year.

Agriculture: 30 CEOs

Summary: Overall influence on long-term organisational performance

Impact of environmental, social and governance sustainability on factors

Environmental, social and governance sustainability positively impacts long-term performance, particularly stakeholder trust and long-term focus. CEOs in agriculture companies were 16 percentage points more likely than total for-profits to say their ESG approach positively impacts stakeholder trust.

Demographics: Agriculture CEOs and Boards

Number of employees

CEO gender identity

For-profit / not-for-profit

■ Agriculture companies ■ Total For-Profits

Female board representation

Ethnic board representation

Women comprise 47.4% of the NZ workforce (Household Labour Force Survey, June 2023, highlighting the importance of examining the systemic barriers that limit their progression to leadership and governance roles.

The 2023 NZ Census showed 47% identify as either Māori (17.8%), Pasifika (8.9%), Asian (17.3%), or other (3%), with 53% primarily NZ European/Pākehā. Boards do not reflect this, emphasising the need to understand the barriers.
